ABSTRACT

Technological proliferation and its rapid intersections with virtual and real are transforming our understanding of the body in digital spaces. The body in digital space is no longer a mere simulation or representation of the physical body but rather a distinct form of embodiment shaped by the mediated affordances of digital technology. The continued alterations in this understanding have critical implications for the issues of identity and agency. Shaped by this context, the paper situates digital identity as a fluid and context-dependent construct, highlighting the importance of continually negotiating and renegotiating one's identity in response to changing prospects of 'filter culture'.

The qualitative study is rooted in the vogue of avatars of Metaverse, Instagram and Snapchat filters, which equip individuals to derive a digital persona skewed out of their physicality.

By examining the patterns of interaction that shape and are shaped by digital identities, the paper aims to theorise spatial performativity - how spaces are actively created, shaped, and given meaning through performative actions. The paper also traces how technocultural determinism - the notion that technological advancements shape and determine cultural practices, societal structures, and human behaviour, sets body and identity apart in terms of digital cues of self. The insights into glocalisation and the malleable nature of digital identities lead to theorising 'exportable', 'replayable' and 'remouldable' bodies.

Keywords: *Digital identity; performativity; ludic culture; culturalization; technocultural determinism.*

6.1 INTRODUCTION

Digital media has permeated every facet of contemporary life. Instagram, Snapchat, and the interactive world of the Metaverse create new landscapes for self-expression, where people put on new avatars, use filters, and curate digital profiles. These technologies have rendered identity formation visible, interactive, and infinitely customisable, mediated by the digital interface. However, as the digital body becomes more than just a representation, what becomes of our conceptions of the “self” as digital spaces provide tools for constant mediation and reshaping of identity. In digital spaces, the body can be experienced as a “second self,” no longer constrained by the physical form but reimaged and reshaped through new digital tools.

Social media filters alter the look of people’s physical features, sometimes making them appear more representative of cultural ideals or adding playful or creative elements, such as animal ears or vintage-style effects. The ability to create and recreate digital avatars also contributes to the complexity of identity in the digital realm, as these virtual realms increasingly blend physical and virtual realities. Identity in the digital realm cannot be fully explained through traditional frameworks but rather must be understood as a fluid construct shaped by the confluence of technological affordances and cultural expectations.

While some users employ digital tools to reflect on or supplement their offline identities, others seek entirely new ways of expressing themselves online. In this sense, identity in the digital realm becomes less a fixed character attribute and more of a performative act shaped by repetition in response to shifting contexts and platforms. The study focuses on how the roles of filters and avatars within evolving ludic cultures, characterised by playfulness and creativity in their engagement, influence the cultivation of peculiar modes of embodiment that transcend familiar ways of thinking about identity and the self.

Taylor and Nichter (2021) discuss how college students use filters to develop distinct aesthetics to create a recognizable personal brand, balancing authenticity and perfection in their posts. This process illustrates how filters embody the paradox of self-presentation, as users simultaneously strive for relatability and idealization, shaped by gendered and cultural expectations of beauty. With the greater embedment of digital interactions in everyday life, digital identities disrupt the conventional understanding of the self and redefine concepts such as authenticity, agency, and embodiment. This mediation occurs through images rather than text, which provide more pictorial expressions of the self than language or storytelling. The visual primacy seen in the Instagram culture of filters and individualised avatars signals a shift in how the self is produced: it is no longer an immutable, interior being but an increasingly performative, fractured, and technologically contingent form of identity. These digital spaces promote aesthetics and playfulness in identity performances, focused not on identity itself but on self-creation for an audience that is simultaneously global in scope yet intimately connected through webs of shared digital networks. Filters provide users with a wide range of manipulations, from subtle adjustments of everyday

pictures to dramatic transformations, allowing them to appear as something resembling themselves yet also highly imaginative and unreal. This affords experimentation with aesthetic identities that go beyond the constraints of a natural body. Avatars in the Metaverse take this even further, enabling users to assume completely new identities that are not necessarily tied to biological reality and thus encouraging identity exploration free from the limitations of a physical form.

Digital platforms enable users to perform a visible self, curating pictures, avatars, and personas that go beyond their biological identities (Wood et al., 2016). This aligns with Judith Butler's notion of identity as "constantly being enacted," shaped by societal expectations and cultural norms (Butler, 1990). Virtual environments take this performativity to an extreme, allowing for the negotiation of identity within fluid, contextual interactions. This challenges definitions of physicality and identity as users experience their 'bodies' in digital space. Mark B N Hansen argues how digital tools produce effective interfaces, enabling users to experience their bodies beyond biological constraints (2003). Hansen contends that digital technologies offer a mediated yet liberating embodied experience as users adopt forms and personas impossible outside the digital realm. Digital identity is sculpted by a "technology of representation," prescriptively outlining forms of self-presentation through platform algorithms, cultural prescriptions, and economic mandates (Zuboff, 2019). In this context, this paper explores how digital spaces facilitate unique forms of embodiment, transforming identity into something that is "exportable" across platforms, "replayable" in different contexts, and "remouldable" based on shifting user preferences and technological advancements.

The paper further contextualises digital identity by exploring the concept of ludic culture, which can be understood as a form of gamification of playfulness in digital engagement rather than a strictly static construct. Gonzalo Frasca's work on the ludic interaction process suggests that the "game-like" aspects of digital platforms stimulate a notion of identity as fluid and experimental (Frasca, 2003). In contrast to traditional forms of identity construction rooted in consistency and stability, ludic cultures tend to foster an identity that can be "replayed" and remade based on the context, circumstances of interaction, and the "rules of play" (Frasca, 2003).

6.2 AESTHETICS AND IDENTITY: UNDERSTANDING FILTERED DIGITAL INTERACTIONS

Filters and avatars have become pervasive tools for formulating digital identities on various platforms. Their usage is embedded within discourses that prioritise visual aesthetics, fluidity, and playful self-engagement. Michele White's understanding of the cultural construction of online environments exemplifies how filters impel users to see self-presentation as a curated project to be managed, with aesthetic decisions at its centre (2006). For instance, the Instagram filters 'WhiteTone' or 'Vintage' or 'peach love' are applied to users' images with colour casts that are likely to produce certain feelings, resulting in an improved, digitised version. This also fits with Sherry Turkle's idea of 'multiple selves' in as much as

these filters allow subjects to generate other selves, ones that might not reflect who they are in the real world but instead match the beauty norms of online platforms (2005).

Avatars also accelerate this discursive shift, enabling users to adopt completely different forms and appearances that radically separate the digital self from the physical body. For instance, avatars in the Metaverse allow people to alter characteristics like skin colour, body type, and attire in ways that far exceed the capabilities of filters. Discussions around these avatars often invoke terms like 'freedom' and 'creativity,' implying that users can explore facets of identity outside the constraints of the physical world. However, this freedom is limited by the pre-set options and possibilities offered by platforms, which reflect a technocultural determinism. Platforms steer users towards representations deemed commercially or aesthetically marketable, prioritising those over avatars that could disrupt normative standards of beauty or identity. So while the rhetoric of filters and avatars celebrates self-expression, it also constrains users by tying digital identity to aesthetic, market-driven norms.

The filters of Instagram and Snapchat often align with Eurocentric or Western beauty standards, featuring smooth skin, lighter skin tones, and enhanced facial symmetry. This aesthetic bias reflects Shoshana Zuboff's critique of surveillance capitalism, as platforms embed commercially viable ideals into their filter designs, nudging users to conform to visual norms that can be easily monetised (Zuboff, 2019). Filters like 'Glow' or 'Perfect Skin' convey an implicit message of a unified, idealised beauty, suggesting that the 'perfect' digital persona is a profitable, aesthetically pleasing construct. Through this content, platforms cultivate a digital identity that caters to audience appeal and gently guides users towards self-presentation that aligns with the platform's aesthetic norms.

While Metaverse avatars ostensibly offer more diverse options for body shape, race, and gender, the choices are ultimately constrained by the platform's parameters. By adapting their personas through site-specific aesthetics and audience expectations, users transform themselves into multifaceted avatars that navigate both online and offline realities (Taylor and Nichter 2021). These parameters lead to technology and aid in representation that subtly guides users towards visually appealing avatars aligning with social and cultural trends. For instance, users may be able to select from a range of skin colours and body types, but the default settings likely favour idealised, muscular physiques and fashionable attire, privileging specific aesthetic values over others. This analysis lends credence to the notion that, although avatars and filters provide opportunities for playful self-expression, they also impose invisible constraints by encoding culturally determined norms into the available options.

The users often use filters and avatars to participate in a form of playful identity experimentation, enacting the ludic culture described by Gonzalo Frasca. For instance, 'face swap' filters on Snapchat allow users to combine their faces with those of others or experiment with fictional looks. More nuanced creators on these platforms, known as 'influencers', employ filters and avatars in calculated

ways to construct identities that align with the norms of their audiences, carefully edited or socially interactive. This performative quality of digital identity reflects how creators engage in a form of identity work that is not merely expressive but designed to appeal to specific audience demographics. The use of 'beauty' or 'celebrity' filters by Instagram influencers, for example, can be seen as deliberate in that it aligns their online selves with culturally dominant ideals of beauty, enhancing their marketability and authority. In this way, the filters and avatars of influencers reveal the economic motives at play, where identity is a currency that can be edited, polished, and commodified to meet audience demands.

6.3 FILTERS AND CUSTOM AVATARS: DIGI-GEARS OF EMBODIED TRANSFORMATION

The rise of filter culture has significantly reshaped how users perceive themselves, often generating a virtual identity that diverges from physical reality. Platforms like Instagram and Snapchat provide filters that offer immediate and customisable modifications, allowing users to enhance facial symmetry, adjust skin tone, or add artificial features like augmented accessories. This customisation helps users achieve an appearance aligned with dominant beauty ideals, creating an idealised self that can separate them from their natural appearance. By using filters regularly, users cultivate an 'embodied' identity that is both visual and performative, adopting characteristics they may not possess physically but that satisfy a psychological or social need for affirmation. The ability to selectively view and present oneself through filtered selfies fuels individual fantasies about appearance, serving the dual purposes of achieving social acceptability and reinforcing one's self-perception (Goetz 2022). Habitual exposure to one's filtered appearance can lead to "digital dissonance"—a tension between one's natural and virtual selves, as users become more attached to their digital persona than their actual look. Many social media users feel more comfortable employing filters that enhance their physical attributes rather than posting unfiltered images. This inclination reveals a psychological shift, where the curated self has become a new baseline of self-perception, even surpassing the unmediated body. By applying filters to align with platform-sanctioned ideals of beauty, people also promote a broader cultural narrative that prioritises aesthetic transcendence over truthfulness.

Avatars in the Metaverse offer a mode of digital embodiment that operates independently of the user's physical characteristics. Unlike filters, which enhance a person's physique, avatars allow users to construct entirely new identities, free from corporeal constraints. For instance, users can select avatars not limited by gender, age, or even species, enabling them to explore self-expressions unbounded by the constraints of the physical body. The Metaverse, with its immersive virtual environments, facilitates a spatial experience that allows users to inhabit these alternate selves, aiding them in experiencing a posthuman existence. These users can create and test out identities they could not or would not be able to in real space. The avatars can also enable explorations of selfhood that are more 'authentic' than their off-screen presentations, as virtual embodiment can bring out more of the 'true self' than the physical body can

accommodate. Users understand these avatars as 'extensions' of the self rather than mere representations, suggesting that avatars offer a new ontology of self-embodiment. In this context, the avatar becomes an experimental identity infusion that enables users to explore and oscillate between various identity markers.

6.4 IDENTITIES IN THE AGE OF LUDIC MECHANISMS

The ludic, or playful, quality of digital identity tools creates a game-like relationship in which users can 'replay' or 'remould' their selves. Social media and virtual worlds provide interfaces that make it fun to experiment with self-presentation, allowing users to create identities that correspond to different states, moods or situations. Theorists have argued that 'homo ludens', or 'playing human', places play at the core of cultural expression and identity (Huizinga, 1955). The rise of modern communication, work, and living conditions, further intensified by digitization, has brought a noticeable alignment with game-like qualities in contemporary actions and experiences (Arlt and Arlt 2023). The processes involved in digital identity construction are also a ludic phenomenon in which users exploit the game-like potentialities of filters and avatars to play with their identities in a situationally sensitive and fluid manner.

The filters allow users to temporarily express certain feelings or personalities without necessarily incorporating them into their fixed sense of self. For example, viewers often use 'funny' or 'distorted' filters as a form of expressive play, constructing short-lived avatars that offer a respite from their usual self-presentation. This playful, contextually responsive approach to identity creation corresponds to Huizinga's concept of play as a "safety zone," a space where one can try out new things without incurring social or psychological penalties. The ludic interactions in digital space are not just about playing but about testing out other aspects of selfhood and exploring different dimensions of one's identity. These playful digital engagements enable users to experiment with various facets of their persona, going beyond surface-level self-presentation to uncover and express deeper, multifaceted elements of their self-concept. The game-like nature of these digital tools facilitates a sense of freedom and safety to try on new identities, which can, in turn, inform and enrich one's understanding of the self. In the Metaverse, users can interact with others through their avatars, enjoying a sense of safety and anonymity. This freedom from real-life social constraints enables them to form connections, build relationships, and develop social skills without fear of judgment or rejection. As they engage with others, users can refine their communication style, experiment with different social dynamics, and learn to navigate complex interactions, all while maintaining control over their virtual persona. For instance, in Minecraft, a user might embody the role of a brave warrior, skilled architect, or esteemed leader, testing boundaries and uncovering hidden talents. This virtual experimentation allows users to uncover new facets of themselves, cultivating a more nuanced understanding of their identity, which remains forever in play.

These platforms grant users the freedom to recast themselves in terms of appearance, action, and even identity, leading us to view the body in the digital

world as a malleable construct. Sherry Turkle contends that such interactions reveal a “second self,” where digital embodiments are not mere extensions of physical bodies but rather separate, autonomous identities with their own distinct characteristics and narratives (2005). The fluidity of digital embodiment decouples physical and virtual bodies, challenging traditional notions of identity rooted in physical characteristics. In the digital realm, people can take on aspects and shapes radically different from their physical selves, redefining ‘embodiment’ as an identity marker. For instance, in virtual worlds like the Metaverse, users can adopt avatars of different genders, ages, or species, experimenting with identity and self-presentation that would be impossible or taboo in the real world. Thus, identity is not an inherent trait but a construct that materialises through iterative actions (Butler, 1990). Identity thus emerges as an open-ended, ongoing process of iteration shaped by the individual, society, and technology. For example, Instagram’s algorithm prefers highly curated, aesthetically pleasing images, which encourages users to utilise filters that enhance the attractiveness of their faces or make their images more visually appealing. Similarly, the Metaverse’s responsive, spatial nature invites users to adopt avatars that align with the platform’s immersive and playful spirit. This identity performance is often creative and challenges traditional gender norms, in contrast with the more stylised, reality-based self-presentation typical of Instagram. These technocultural factors reflect how digital platforms act as co-creators of identity. Users tend to conform their identities to the presumed norms of appearance on individual platforms, a performative conformity that helps to reinforce platform-specific identity norms.

In immersive, avatar-based platforms, users’ interactions can evoke emotional responses akin to those felt in the physical world. For example, in the virtual realm of Second Life, users’ avatars may engage in intimate relationships, fostering emotional connections and a sense of attachment. These users may experience feelings of joy, empathy, and even grief, confirming the notion of an “extended self” in digital spaces (Belk, 2013). This dynamic, along with the algorithmic technological curation, not only influences how users present themselves but also how they understand their social value. The platforms that prioritise visual feedback loops, such as Instagram and Snapchat, lead users to evaluate themselves based on the perceived appeal of their digital embodiment, which is itself shaped by the affordances of those platforms. This occurs because the platforms’ algorithms and design features, including likes, filters, and curated aesthetics, subtly encourage users to conform to platform-specific norms of attractiveness and identity presentation.

6.5 UNDERSTANDING THE GLOCAL

The amplification of filters and avatars is set in an environment of constant interactions between the local and global through constant adaptations and resistance. These interactions shape digital identities, though typically influenced by cosmopolitan aesthetic norms and social practices, and also create opportunities for individuals to include and transform local culture. On platforms such as Instagram, where home-grown content becomes viral across widely

different cultural contexts, digital identities tend to accrue 'exportable' qualities that are global yet culturally specific. Users, drawing from different cultures, incorporate traditional dress, language or symbolism into their online self-presentation, putting local markers of identity into globally acceptable forms. This conflation reflects a kind of cultural resistance in which users push back against complete assimilation to global norms of identity by reasserting local identities under a universal spatial system.

Meanwhile, users of these digital platforms from different cultures might use globally popular filters or avatars but adapt these digital expressions to suit local morality or aesthetics. Through the acts of cultural negotiation between global flows of information and local cultural contexts, individuals construct hybrid identities that resonate with both global and local meanings. This glocalisation is particularly identifiable in the Global South, where users tend to stick with their cultural markers such as language, traditional dress, or regional aesthetics. The resulting hybrid identities occupy a liminal zone between the universal and particular, global and local, challenging the totalising force of digital globalisation and asserting the agency of local. This underlines the notion that glocalization fosters inclusivity and embraces diversity, encouraging mutual understanding and value-sharing across social, cultural, and academic domains through ongoing processes of identity negotiation and renegotiation (Tulgar 2021). The use of avatars and filters by Indian youth on social media platforms like Instagram and Snapchat exemplifies this ludic turn, where traditional and modern elements are recombined to produce novel forms of self-representation that reflect a unique synergy between the global and the local, crafting digital identities that are simultaneously universal and culturally specific.

This production of glocal identities is aided by the users' "ludoliteracy" (Raessens 2014), which allows them to engage playfully and creatively with digital platforms. This ludoliteracy, or digital playfulness, stands in contrast to notions of passive assimilation, driving individuals to "adjust the system or play the system" (Raessens, 2014) - to actively shape and negotiate their digital identities within the constraints of the platform. The creative and improvisational nature of digital identity production demonstrates the agency of users, even within the highly structured and commercialised contexts of contemporary digital platforms (Sinnreich, 2020) (Ryoo, 2009) (Ghosh, 2011). The ludic-glocal nexus of digital identity, marked by its adaptability, multiplicity, and performativity, effectively renders identity as a verb rather than a noun.

6.6 CONCLUSION

Digital identity in the contemporary age is a fluid, performative construct deeply embedded in the affordances of digital technologies and shaped by cultural expectations. Filters, avatars, and playful engagement with identity on platforms such as Instagram, Snapchat, and the Metaverse demonstrate how the self is no longer constrained by physical limitations. Instead, digital tools enable users to create, curate, and negotiate identities that are playful, contextual, and customisable. These digital embodiments challenge static notions of identity by

emphasising its performative and relational nature, redefining the boundaries of selfhood in increasingly mediated spaces. The body is experienced as a product of physicality and its digital reimagination. The performativity of digital identity heightens self-expression, which negotiates between personal choice, cultural ideals, and platform affordances.

Digital identity construction, influenced by ludic culture, digital dissonance, and technocultural determinism, is tangibly manifested in everyday online interactions. The ludic culture encourages playful experimentation with Instagram and Snapchat filters, enabling users to temporarily adopt whimsical or aesthetically idealised personas. This playfulness highlights the performative aspect of digital identity as users “try on” identities without long-term commitments, akin to a game. However, digital dissonance arises when users become more attached to their filtered appearances than their natural ones, creating a psychological divide between physical reality and curated digital self-presentation.

Digital identity thrives on the possibility of constant recreation, replayability, and adaptation, emphasising the ludic, iterative, and experimental nature of digital self-presentation. This fluidity is further complicated by globally accessible yet culturally coded tools and aesthetics, leading to glocal identity formations. This hybridisation challenges the universalising force of digital platforms, depicting the self as no longer a cohesive entity but a fractured self, constituted through acts of self-presentation and shaped by audience feedback, platform algorithms, and cultural frameworks. This fracturing is not necessarily a loss but an evolution, offering opportunities for identity to become more inclusive, imaginative, and fluid.
